Moving beyond the current fragmented cancer care landscape toward a more integrated approach to cancer care.

Removing “silos” between cancer specialists, primary care physicians, affiliated healthcare providers & patients is a big challenge.

Rapid, exponential progress in available technology, data analytics & cancer treatment approaches demand significant changes in the skill sets of physicians.

Diagnosing cancer earlier significantly improves the chances of successful treatment outcomes. With earlier diagnosis, more cancers will be targeted & treated locally (at the tumor site) rather than systemically.
